You may also find the following organisations to be useful sources of information and advice: Things you can try yourself Support groups for BDD Some people may find it helpful to contact or join a support group for information, advice and practical tips on coping with BDD. Check here for alerts. Your doctor will keep a close eye on you over the first few weeks. Medication should only be suggested after they have seen a psychiatrist and been offered therapy. This involves gradually facing situations that would normally make you think obsessively about your appearance and feel anxious. It's important to tell them if you're feeling particularly anxious or emotional, or are having thoughts of harming yourself. SSRIs are a type of antidepressant. There are some common side effects of taking SSRIs, but these will often pass within a few weeks. It can be very difficult to seek help for BDD, but it's important to remember that you have nothing to feel ashamed or embarrassed about. Body dysmorphic disorder BDD, or body dysmorphia, is a mental health condition where a person spends a lot of time worrying about flaws in their appearance. They may offer you more CBT or a different kind of therapy, as well as a different kind of antidepressant. Your therapist will help you to find other ways of dealing with your feelings in these situations so that, over time, you become able to deal with them without feeling self-conscious or afraid. Your GP may refer you to a mental health specialist for further assessment and treatment, or you may be treated through your GP. Seeking help is important because your symptoms probably won't go away without treatment and may get worse. Some people also find it helpful to get together with friends or family, or to try doing something new to improve their mental wellbeing. It may also be helpful to try some relaxation and breathing exercises to relieve stress and anxiety. If they work for you, you will probably be asked to keep taking them for several months to improve your symptoms further and stop them coming back.⁷⁴ patients who had DSM-IV confirmed BDD with or without a delusional disorder for 26 months, were 18.65 years of age, scored 24 on the Yale-Brown Obsessive Compulsive Scale Modified for Body Dysmorphic Disorder (BDD-YBOCS), and scored at least moderate on the Clinical Global Impression scale for BDD. Mar 5, - 53% of subjects responded to fluoxetine compared to 18% to placebo. Treatment efficacy was independent of the presence of major depression or OCD.
