Usage of frusemide without medical supervision is not routinely recommended. On most treks, gradual ascent is possible and prophylaxis tends to be discouraged. It is unwise to ascend while taking dexamethasone: Many pilgrims at the annual festival at Gosainkunda lake in Nepal suffer from HACO following a rapid rate of ascent, and respond remarkably well to dexamethasone. The treated climbers also had less difficulty in sleeping. Gradual ascent is always desirable to try to avoid acute mountain sickness even when acetazolamide is being taken. Dexamethasone can be highly effective: The treatment dosage is mg daily. It has been known to cause stomach irritation, euphoria or depression. It may therefore, be better to take mg half a tablet twice daily. However, gradual ascent is always desirable to try to avoid acute mountain sickness but if rapid ascent is undertaken and acetazolamide is used, it should be noted that such use does not obviate the need for a prompt descent if severe forms of high altitude sickness occur, i. To access this special service: It can be a good "emergency drug" since it "buys time" especially at night when it may be problematic to descend. By accessing the interactive part of this web site you can obtain a list of all the medicines necessary for your trip. In people allergic to and therefore unable to take acetazolamide, dexamethasone can also be used for prevention: Strenuous activity at altitude will already increase the likelihood of dehydration no need to make it worse by taking a medication prophylactically that you may not even need. 4. Report If you read the potential side effects of diamox, you'll notice that they can even be confused with altitude unahistoriafantastica.com- Altitude sickness- Warnig. Apr 1, - You need to start taking it 24 hours prior to ascent. I have also seen that dosages for Diamox differ mg 2x/day is sufficient (it's what my travel clinic prescribed and what is recommended on unahistoriafantastica.com the physician's resource). It does cause tingling in the extremities and increased urination. Acetazolamide is used to prevent and reduce the symptoms of altitude sickness. This medication can decrease headache, tiredness, nausea, dizziness, and shortness of breath that can occur when you climb quickly to high altitudes (generally above 10,000 feet/3,000 meters). It is particularly useful in situations when you. Is Diamox, Diamox Sequels (acetazolamide) available as a generic drug?
