Always talk to your doctor before using any medications while you are pregnant to ensure they are safe. One dose early should not cause serious damage, but using this drug during the third trimester could be very dangerous. During pregnancy, your body goes through numerous changes as it supports the healthy development of your baby and prepares for delivery. While these drugs are readily available over the counter, there are side effects of taking ibuprofen which should be considered before use. If cramping becomes worse than menstrual cramping, especially if it is accompanied with bleeding and lower back pain, it is important to contact your doctor as soon as possible. As the uterus grows, the sciatic nerve which runs from the lower back down the back of the leg may have pressure put on it. All content, including text, graphics, images, and information, contained on or available through this website is for general information purposes only. Here is a general outline of pain relievers along with different guidelines for what can and cannot be used during pregnancy. Headaches are also common during pregnancy. Such contractions are generally uncomfortable rather than painful. Your baby and relaxed pelvic joints may put additional pressure on the sciatic nerve. In Late Pregnancy Taking ibuprofen in your third trimester carries a significant risk. However, if they are severe and do not go away after resting or taking Tylenol, or if you notice vision changes or light sensitivity, contact your health care provider immediately. Round ligament pain occurs as the uterus grows, causing the round ligaments to stretch. Aspirin can also cause heavy bleeding during labor if taken a few days before delivery. Studies have indicated that boys born from women who used painkillers during their second trimester could be born with undescended testicles. You can find considerable relief from the pain with short acting non-steroidal anti-inflammatory drugs (NSAIDs), such as ibuprofen (Advil or Motrin). Being Prepared for Child Birth Considerably Reduces the Use of Pain Medicines The fear of giving birth and being unprepared potentiates the amount of labor pain. If you are, you can only have Tylenol. Ibuprofen is an NSAID and all NSAID pain relievers (Ibuprofen, Motrin, Aleve, Aspirin) are no no's during pregnancy. -- I was told that even aspirin was a "safer" choice (so long as not taken in the late 3rd trimester or within 2 ish months of delivery). Ibuprofen's reason for being Advil during Labor?
