Jan;11(1) Pharmacokinetics of amoxicillin: dose dependence after intravenous, oral, and intramuscular administration. Spyker DA, Rugloski RJ, Vann RL, O'Brien WM. Amoxicillin was studied in normal subjects after intravenous, oral, and intramuscular administration of The more frequent amoxicillin dosing may lead to compliance problems. To compare the pharmacokinetics and levels of amoxicillin in plasma in the current WHO acute respiratory infection recommendations with the mg/kg/dose b.i.d. regimen, we performed a two-group parallel study of 66 children ages 3 to 59 months. Pharmacokinetics of amoxicillin. Amoxicillin, a new semisynthetic penicillin, was administered in mg doses intravenously and orally to normal men. After intravenous doses, the mean alpha disposition constant was. hr<sup>-1</sup> and the mean beta disposition constant was hr<sup>-1</sup> with a corresponding beta half-life of. Jun 20, - AbstractObjectives. To describe the population pharmacokinetics of oral amoxicillin and to compare the PTA of current dosing unahistoriafantastica.com. Two groups, eac. Jun 13, - A broad-spectrum semisynthetic antibiotic similar to ampicillin except that its resistance to gastric acid permits higher serum levels with oral administration. Amoxicillin is commonly prescribed with clavulanic acid (a beta lactamase inhibitor) as it is susceptible to beta-lactamase degradation. Amoxicillin was studied in normal subjects after intravenous, oral, and intramuscular administration of , , and 1,mg doses. Serum drug levels were analyzed using a two-compartment open model, as well as area under the curve (AUC) and urinary recovery. The variations of these pharmacokinetic parameters. Amoxicillin, also spelled amoxycillin, is an antibiotic useful for the treatment of a number of bacterial infections. It is the first line treatment for middle ear infections. It may also be used for strep throat, pneumonia, skin infections, and urinary tract infections among others. The intravenous and oral pharmacokinetics of an amoxi- cillin and clavulanic acid combination (20 mg/kg of so- dium amoxicillin and 5 mg/kg of potassium clavulanate) were studied in six goats. After intravenous administra- tion the pharmacokinetics of both drugs could be descri- bed by an open two-compartment model. Background: A new oral pharmacokinetically enhanced formulation of the broad-spectrum antibiotic amoxicillin/clavulanate has been developed to provide more effective therapy against resistant pathogens than is provided by currently available formulations by maintaining therapeutically useful plasma amoxicillin.
