It depends on your personality. Both drugs are commonly prescribed, with Drug Abuse. For anxiety-prone people, benzos quiet the mind, shushing the paralyzing background noise and leaving you to do your work unmolested. The drugs work by causing nerve impulses throughout your body to slow down, which results in an overall sedating, calming effect. It also increased concentration: Of these, Klonopin gives the smoother ride. How the hell is everybody getting through their workday? According to UPI, "prison staff allegedly took the bottle away and didn't give him his medication during the six days he was there, even though he asked for it numerous times and suffered terrifying delusions due to withdrawal from the medication. As explained in the book *Pharmacology for Anesthetists*, by Dr. Both drugs can cause withdrawal symptoms when suddenly stopped. Klonopin gives you less of a buzz, is much longer lasting sometimes it seems like Xanax only lasts two or three hours, and is less habit-forming. I've relied on Xanax for special occasions and party reporting all that excitement sends me straight to the wall, but recently-after totally casual anecdotal investigation on this website suggested that Klonopin was the current drug of choice for the creative underclass. I procured a prescription for Klonopin. Which is the best for you: After all, they love it at downtown fashion mag Nylon! Adderall or benzos like Klonopin? Klonopin is better than Xanax, my friends. For those with wandering attention spans, Adderall usually does the trick. MacGrory explained that abuse in both can be accidental or intentional. According to Healthline, both are central nervous system depressants which work by affecting the neurotransmitter in the brain known as gamma-aminobutyric acid GABA. When used in ways other than those prescribed by a physician, the drugs can cause problems with speech and coordination, poor memory and concentration, and feelings of disorientation.
