The anti-anabolic action of the tetracyclines may cause an increase in BUN. If you are a U. Healthcare Professional, click OK to continue. As with other antibacterial preparations, use of this drug may result in overgrowth of nonsusceptible organisms, including fungi. Because magnesium is excreted primarily by the kidney, serum levels of magnesium should be monitored in patients with renal impairment. If visual disturbance occurs during treatment, prompt ophthalmologic evaluation is warranted. Tetracycline drugs, therefore, should not be used during tooth development unless other drugs are not likely to be effective or are contraindicated. Enamel hypoplasia has also been reported. This reaction was shown to be reversible when the drug was discontinued. Under such conditions, monitoring of creatinine and BUN is recommended, and the total daily dosage should not exceed mg in 24 hours. If superinfection occurs, the antibacterial should be discontinued and appropriate therapy instituted. Home Page If difficulties persist, please contact the System Administrator of this site and report the error below.. An error has occurred while processing your request. These symptoms may disappear during therapy and usually disappear rapidly when the drug is discontinued. Results of animal studies indicate that tetracyclines cross the placenta, are found in fetal tissues, and can have toxic effects on the developing fetus often related to retardation of skeletal development.
