Call your doctor for medical advice about side effects. Avoid concomitant use of PRANDIN with clopidogrel. If concomitant use can not be avoided, initiate PRANDIN at mg before each meal and do not exceed a total daily dose of 4 mg [see DRUG INTERACTIONS, CLINICAL PHARMACOLOGY]. Do not exceed a total daily dose of 6 mg of PRANDIN in patients receiving. Jump to Pharmacology - Pharmacology. Indication. As an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus. Structured Indications. Type 2 Diabetes Mellitus. Pharmacodynamics. Insulin secretion by pancreatic  $\beta$  cells is partly controlled by cellular membrane potential. Identification Economics Properties Taxonomy. Repaglinide is an antidiabetic drug in the class of medications known as meglitinides, and was invented in Repaglinide is an oral medication used in addition to diet and exercise for blood sugar control in type 2 diabetes mellitus. The mechanism of action of repaglinide involves promoting insulin release from  $\beta$ -islet Biological half-life?: 1 hour. oxides (yellow and red, respectively) as coloring agents. CLINICAL PHARMACOLOGY. Mechanism of Action. Repaglinide lowers blood glucose levels by stimulating the release of insulin from the pancreas. This action is dependent upon functioning beta ( $\beta$ ) cells in the pancreatic islets. Insulin release is glucose-dependent. Repaglinide is an antidiabetic drug that belongs to meglitinide category. The mechanism of action of repaglinide is to lower blood glucose levels by blocking ATP-dependent potassium channels in pancreatic beta cells, which in turn, stimulates insulin secretion. Repaglinide acts in a dose-dependent manner, and is. Pharmacology. Metabolism: liver; CYP 2C8, 3A4 substrate; Info: OATP1B1 substrate. Excretion: feces 90% .
