However, if you would like to, you can change your cookie settings at any time. Although there is no scientific proof from seven out of the eight studies carried out that there is a link between taking escitalopram in early pregnancy and having a baby with a heart defect, there are fewer studies of escitalopram use in pregnancy than other SSRIs, and heart defects have been shown to occur slightly more frequently in babies of mothers who took SSRIs other than escitalopram in the first trimester of pregnancy. They can access more detailed medical and scientific information from [www.nineofthese.com](http://www.nineofthese.com). Nine of these studies showed that the motor development of children whose mothers had taken SSRIs during pregnancy was slightly poorer. If you have any questions regarding the information in this leaflet please discuss them with your health care provider. Every pregnancy is unique. Further research into this subject is, however, required. Login to my bumps Join my bumps. However, most studies which have analysed information from pregnant women taking any SSRI do not show a link with having a smaller baby. PPHN only affects around 1 or 2 out of every newborn babies but can be serious. The decision to start, stop, continue or change a prescribed medicine before or during pregnancy should be made in consultation with your health care provider. If you continue without changing your settings, we'll assume that you are happy to receive all cookies on the Bumps website. Sometimes this may have beneficial effects for the baby. Most women will be offered a scan at around 20 weeks of pregnancy to look for birth defects as part of their routine antenatal care. It is important to remember that around one in every children develop ASD, regardless of whether their mother took any medicines in pregnancy. Do not make any change to your medication without first talking to your doctor. It is known that about one in every babies is born with a heart defect, regardless of whether their mother took any medicines during pregnancy. Although a number of studies of women taking any SSRI during pregnancy have shown links with premature delivery, we do not know how this relates to women specifically taking escitalopram. No increased risk of miscarriage in women taking escitalopram during early pregnancy was shown in either of two studies that have looked at this. Unfortunately, the onset of pregnancy can trigger depression. As such, it is common to question if it is safe to use escitalopram during pregnancy. Using escitalopram during pregnancy may be the right option if the benefits outweigh the risks to your developing baby. It is important to discuss escitalopram use during your. Jun 25, - I am 14 weeks pregnant and chose to go off of Lexapro when I found out I was pregnant. I am horribly depressed but have chosen to stay off of the Lexapro due to the possible affects on the fetus. However, I suffered post partum depression so severely with my first child and I have suffered depression much Does Lexapro 10mg make you feel high when you. I've been on escitalopram (generic Lexapro) for years too. My doctor told me I should taper off, unless I felt being off it (massive anxiety, depression, etc) would be worse for me. I stopped as soon as I saw the positive pregnancy test, but my doctor said I really shouldn't just quit cold turkey. I've been taking. Jul 18, - I took 10 mg of Lexapro through my entire pregnancy and while breastfeeding. I have a perfectly happy, healthy 2 year old now. I am pregnant again and am going to continue taking the Lexapro through this pregnancy also. I can not imagine what my anxiety would be like if I didn't take the Lexapro. May 1, - One study showed citalopram might cross the placenta in lower amounts than some of the other SSRI medications. There are no large studies looking at the chance of birth defects when escitalopram is used during pregnancy. Since it is very similar to citalopram, escitalopram is also unlikely to increase the. When deciding whether or not to take escitalopram during pregnancy it is important to weigh up how necessary escitalopram is to your health, against the possible risks to you or your baby, some of which will depend on how many weeks pregnant you are. Remaining well is particularly important during pregnancy and while Missing: generic. Dec 5, - Both citalopram and escitalopram are antidepressants belonging to the SSRI class. While escitalopram (marketed in the U.S. as Lexapro) contains only the S-stereoisomer (or enantiomer) of the drug citalopram, Celexa or generic citalopram is a racemic mixture of the S-citalopram and its mirror image. She was started on a dosage of escitalopram 10 mg that was increased after 2 weeks to 20 mg every morning. Ms. A. was maintained on this dosage throughout the pregnancy and was also seen biweekly for supportive counselling. By week 24 of her pregnancy, her depression lifted, and her Edinburgh score

was down to 4 Missing: generic. Before a generic version hit the market in , Lexapro was one of the most popular medications for treating major depression. Research studies show women who take SSRI drugs, including Lexapro, while pregnant have an increased risk of giving birth to a child with autism and birth defects. In , the FDA issued a. However, you may have a relapse of depression if you stop taking your antidepressant during pregnancy. If you are planning a pregnancy, or if you become pregnant while taking escitalopram, do not stop taking the medication without first talking to your doctor. Escitalopram can pass into breast milk and may harm a nursing.
