Ivermectin, when dosed at the low dosage ranges necessary to prevent infection with heartworms, is generally considered to be safe for dogs of all breeds, including Collies, Shelties, Australian Shepherds, and English and Old English Sheepdogs. Not all individual dogs in the breeds listed above carry the mutant gene. There is a test for this gene mutation which can be performed to determine whether an individual dog carries this gene mutation or not. Dogs may also drool excessively. It is also used to treat ear mites as well as hair mites, which can cause mange. They can also seem disoriented and unresponsive to you. Appetite and Digestive Problems: Ivermectin is one of the most commonly used heartworm prevention medications used for dogs. If you have more than one dog, it becomes too much of a hassle. Additionally, certain dogs are genetically hypersensitive to the medication. Ivermectin is a neurotoxin which helps prevent parasites from being attracted to dogs and it kills parasites after an infestation has happened. Collie Old English sheepdog Shetland sheepdog Sheltie Australian shepherd German shepherd Longhaired whippet Silken windhound Border collie Dogs of mixed breeds that include herding breeds This genetic sensitivity is due to a mutation in what is called the MDR1 gene. Dogs with this genetic defect lack a certain protein that prevents Ivermectin from being flushed from the brain so that it builds up -- this can happen quickly or over a period of time. In these breeds, Ivermectin can pass directly to the brain and be toxic or even lethal. A genetic sensitivity to ivermectin can be seen in several breeds, but is more commonly seen in the following breeds: Border Collie Old English sheepdog Shetland sheepdog (Sheltie) Australian shepherd Rough collie Dogs of mixed. Jan 9, - As far as the internet reports on cases of ivermectin sensitivity in border collies, as I said, I contacted the people who do the gene test and they said no border collies had been confirmed to have the mutation. I asked specifically about the unconfirmed reports and they are still unconfirmed. The number of Border collie sensitivity to ivermectin and other drugs - Health. Sensitivity of Collies to certain pharmaceuticals, in particular for treatment of heartworm and mites (ivermectin), is now known to be caused by a genetic defect in the mechanism that prevents drugs from building up in the brain. This mutation is recessive and is called *mdr1*?. The normal gene that protects the brain is called. Recognizing that the collies and other herding breeds that were sensitive to ivermectin were similar to the *mdr1* knockout mice, Dr. Katrina Mealey at Washington It is normally expressed in the apical border of intestinal epithelial cells, brain capillary endothelial cells, biliary canalicular cells, renal proximal tubular epithelial. sensitive to ivermectin.1,2. J Dogs with an ABCB1 mutation are also predisposed to increased sensitivity to moxidectin, loperamide, milbemycin, and chemotherapeutic agents. J Common breeds with this mutation include the border collie, Australian shepherd, long-haired whippet, silken windhound, rough- and. Feb 18, - Ivermectin may not be safe for collies and similar breeds at higher dosages. The increased sensitivity of these breeds of dogs is a result of a mutation of the MDR1 (multi-drug resistance) gene. Dogs with this genetic defect lack a certain protein that prevents Ivermectin from being flushed from the brain so. May 7, - However, the MDR1 gene mutation can be fatal when affected Aussies are exposed to medications like Trifexis and Ivermectin for dogs. . Collie; Old English Sheepdog; English Shepherd; Shetland Sheepdog (Sheltie); German Shepherd; Longhaired Whippet; Silken Windhound; Border Collie; McNab. Sep 25, - This drug sensitivity can result in blindness, coma and death, so it is very important that collie owners, and the owners of other herding breeds like Aussies or Border Collies, become familiar with the names of these drugs. There are veterinarians who seem to be unaware of this issue, and prescribe drugs or. Ivermectin prevents or kills parasites by causing neurological damage to the parasite, resulting in paralysis and death for the parasite. But dogs genetically sensitive to the medication have an anomaly that allows the ivermectin to pass the dog's blood-brain barrier and into its central nervous system, which can be lethal for. Apr 1, - I have heard that Border Collies are sensitive to ivermectin and so I shouldn't be giving my dog Heartgard because it might kill her. But since Heartgard is a heartworm preventative, isn't it worse to not give them their Heartgard than better? I have a friend that gives her Border Collies ivermectin from a cattle.
