A lower dose of 60 mg administered orally three times daily alone or in combination with metformin may be given to patients whose HbA 1c values are near goal. There have also been no documented interactions with highly protein bound drugs. Data show that average blood glucose, expressed as HbA 1c , may predict the risk of coronary heart disease morbidity and mortality. Return to Pharmacotherapy Update Index. The patients that are best suited for therapy with nateglinide include 1 newly diagnosed patients after non-pharmacological measures have not controlled blood glucose and 2 patients in need of better control with metformin. Nateglinide 60mg, mg; tabs. Upper RTI, back pain, flu symptoms, dizziness, arthropathy, diarrhea; hypoglycemia, weight gain. Its half-life is approximately 1. Hyperglycemia may also be a risk factor for macrovascular disease. Since nateglinide does not cause late hyperinsulinemia due to its rapid onset of action and short duration of effects, the risk of hypoglycemia can be reduced. The safety and effectiveness of nateglinide in pediatric patients have not been established. Save up to 67% on Nateglinide. Find big savings at pharmacies near you with GoodRx discount coupons.
