Pharmacokinetics of prednisolone transfer to breast milk. Prednisolone transfer to breast milk was studied in three nursing women who required oral steroid therapy for asthma. Each patient received a 50 mg intravenous dose of prednisolone phosphate, and blood and breast milk were sampled for 6 hours. Concentrations. Because of the low amounts of prednisolone recovered from breast milk, it is concluded that administration of prednisolone to nursing mothers does not appear to pose a clinically significant risk to breast-fed infants. It is also suggested that infant exposure to prednisolone through breast milk can be minimized by dosing. References Committee on Safety of Medicines, Medicines Control Agency.
